BECKERT'S *Garden, Flower & Lawn* SEEDS

Remarks to Purchasers

READ CAREFULLY BEFORE ORDERING.

Name and Address. Write your **Name, Post Office, County, and State** as plainly as possible. Sometimes orders reach us which give neither name nor location. In such cases it is impossible for us to fill orders until we hear from the senders again.

Use the Order Sheet. Make out your list of requirements in the order given in the Catalogue, placing the quantity wanted before the article, and the price of the same in the column to the right. Always keep a copy of your orders.

Correspondence should not be intermingled with the body of the order, but either written at the bottom of the Order Sheet, or on a separate sheet of paper.

Remittances. The safest method of sending money is by **Post Office Orders**; where they are not obtainable, it can be sent by Express Money Order, Registered Letter, or Draft on New York. For small amounts, postage stamps are acceptable.

When the Remittance is not sufficient to pay for the quantity of seeds ordered, we will reduce the quantity to correspond with the remittance.

Errors. All possible precautions are taken to avoid their occurrence. Notify us at once if your order is not filled as it should be, and we will promptly make the necessary corrections.

Substitution. Late in the season we may have sold all our stock of some particular article ordered. We will in such case substitute the variety nearest akin to it, if requested to do so; otherwise the money will be refunded.

For Prices on Large Quantities of Seeds, write for our Market-Gardeners' or Florists' Catalogue, which is, however, only furnished on presentation of business card, or other evidence sufficient to show that the applicant is entitled to the same.

Send Us Your Order as Early as Possible. It will facilitate the prompt execution of same, and you will have your seed when you are ready to plant.

Packing. No charge for packing or delivery to depots, boats, or express offices. In no case do we prepay Express or Freight charges, unless by special agreement.

Seeds Free by Mail. All Vegetable and Flower Seeds quoted in this Catalogue by the **quarter-pound, ounce or packet** are forwarded postpaid at the prices herein named. Postage must be added for seeds by the **half-pound, pound, pint or quart**, as stated under the headings. We reserve the privilege of sending seeds by express, prepaid, if more suitable to us.

Seeds by Express. Seeds can now be forwarded at 20 per cent less than the merchandise rates; a saving of one-fifth to the buyer over previous rates. Unless goods are of a perishable nature, we can send C. O. D., if requested. As prices are all given in the Catalogue, there is no necessity for having goods forwarded in this manner, the purchaser thereby incurring the extra return charges.

Shipments by Freight. Seeds in bulk, implements, and other heavy goods we ship by freight. Unless there is a freight agent at point of destination, the freight must be paid in advance, and, unless by special arrangement with us, the purchaser must advance the same. Our facilities for shipping to points south of Pittsburg on the Ohio River and connecting streams are excellent, steamers plying daily between here and southern points. Points above Pittsburg, on the rivers, are also accessible by boat.

Catalogues are sent free to all our customers of the **past year**. Should any change their place of residence, we desire them to inform us, that we may correct the address in our Catalogue list. Our local customers, who purchase over our counters, will please leave their address when making their first annual purchase; this will ensure their receiving Catalogues the following year by mail. Great numbers of our patrons who desire our Catalogues fail to receive them because we have not their post office address.

Correspondenzen und Bestellungen in deutscher Sprache erhalten dieselbe Aufmerksamkeit als diejenigen in englischer Sprache.

PEAS (Erbsen)

All smooth-seeded Peas may be planted as early in the spring as the soil can be prepared for them, being very hardy. Sow for the first crop as early as practicable, and for succession at intervals of about two weeks until June. Late sowings, however, do not yield so well as early ones. Sow in drills about 2 to 3 inches deep, and from 2 to

4 feet apart, according to variety, taller sorts requiring more room than dwarf ones. Dwarf Peas require a very rich soil, while tall ones thrive best in rather thin ground. The latter are frequently sown in double rows, with the brush, or sup-

port of some kind, between them. Wrinkled Peas are not so hardy as the smooth sorts, and should not be sown quite so early, but are superior to them in quality, more delicate in flavor, and remain longer in season. One quart of seed will plant about 100 feet of drill.

For Peas to be sent by mail, add postage at the rate of 8 cts. per pint, 15 cts. per quart, to prices given. Wrinkled varieties are marked with a star.

BEANS

Beans should not be planted before the ground becomes light and warm, in favorable seasons usually about the first of May. The soil should be rich and mellow, and the seeds scattered about 3 inches apart in drills that are 2 to 2½ feet apart, and covered about 2 inches deep. Successive sowings, made at intervals of about two weeks until the middle of July, will give a plentiful supply of beans throughout the season. One quart of seed will sow 100 feet of drill.

Add 8 cents postage for one pint of seed, and 15 cents for one quart when to be sent by mail; 10-cent packets free by mail

POLE, or RUNNING BEANS (Stangen Bohnen)

Less hardy than the Bush Beans, and should be planted several weeks later, when the ground is warmer. Plant the seeds in slightly raised hills 3 or 4 feet apart, 4 or 5 seeds to the hill. The Limas are especially tender, and the rule for late outside planting with them is rigid. Painstaking cultivators, who are usually the most successful, plant them eye downward, after setting stout poles for every hill. All sorts of late ripening Pole Beans are benefited by pinching the tips of the vines back when they are about 5 feet high. A quart of Limas will plant about 100 hills; a quart of smaller sorts about 200.

CORN, Sweet or Sugar

(Maiz)

This delicious vegetable may be enjoyed from early summer until frost if the proper varieties are selected and planted for succession at intervals of every two weeks until the middle of July. If the seed is planted too early, before the ground becomes warm, it is liable to decay. Plant in hills 3 or 4 feet apart each way, five to six kernels to a hill; or in rows 4 or 5 feet apart, scattering the seeds thinly in the rows. The taller-growing the variety, the richer should be the soil and the wider the space allowed for development. One quart will plant 200 hills.

If to be sent by mail, add 10 cents per quart for postage. 10-cent packets of all kinds sent postpaid

ARTICHOKE (Artischocke)

Sow early in spring and transplant the following spring to permanent beds in rows or hills 3 feet apart.
LARGE GREEN GLOBE. The best sort for general use. Pkt. 10 cts., oz. 35 cts.

ASPARAGUS (Spargel)

A bed once properly made and planted will last for years. Plenty of fertilizer should be well trenched in to a depth of 2 feet or more. The roots should be planted as early in the spring as the ground can be prepared, setting them a foot apart in rows, 2, 2½ or 3 feet apart, with the crowns from 4 to 6 inches below the surface of the bed. Asparagus seed may be sown directly in the permanent bed and the plants thinned as they grow; or it may be sown elsewhere, and the seedlings transplanted the second year. An ounce of seed will sow 50 feet of drill, and produce about 300 plants. Fair crops may be expected the third year from seed.

THE BEST GARDEN BEETS

(Salatrüben)

The soil best suited to the Beet is a deep, light and rich loam. For very early crops, the seed is sown in hotbeds, and the seedlings are transplanted to the open ground. For main crop, the seed is sown outside as soon as the soil is in good condition, in drills from 12 to 15 inches apart, and covered about an inch deep; the plants are thinned to stand 4 or 5 inches apart in the rows. For winter crops, sow seed in June, in drills, as for early Beets. An ounce of seed will sow 50 feet of drill; five or six pounds an acre.

CARROTS

(Möhren)

Carrots succeed best on heavy loam, which preferably should have been well fertilized the previous year, as fresh manure often causes the roots to grow pronged and misshapen. Sow the seed as early in the spring as the ground can be prepared, firming the soil down over them. An ounce of seed will sow 100 feet of drill; 4 pounds will sow an acre.

CELERY (Sellerie)

Celery can be grown in any garden soil, but is finest on deep, mellow bottom land. Seed for early crops should be sown in hotbeds about March 15. The plants may either be thinned to give them room to grow, or transplanted to another bed to grow until it is time to plant them in the open ground. For main crop, seed should be sown in the open air as soon as the soil and air are warm enough. They should be covered lightly, or merely pressed into the earth with a board if the soil is fine and mellow. The seed-bed must be kept free from weeds, and well watered in dry weather. When the plants are large enough, transplant them to shallow trenches or furrows, from 4 to 6 feet apart, according to the variety grown, setting the plants 6 inches apart in the rows and pressing the soil firmly around them. Blanching consists of drawing earth up to the stalks at intervals of about two weeks, until all but the tops of the plants are covered. Celery may be kept for winter use in pits or cellars, or in deep, narrow trenches, in a dry situation; the latter must be covered with boards, with sufficient soil and manure on top to keep out the frost, leaving openings for ventilation in mild weather at short distances. An ounce of seed will produce about 2,000 plants.

GOLDEN SELF-BLANCHING. Stalks beautiful golden yellow. Plants semi-dwarf and vigorous, with large, ribbed and rounded stalks which are quite crisp and tender. Pkt. 10 cts., oz. 35 cts., $\frac{1}{4}$ lb. \$1.30.

WHITE PLUME. Easily blanched, and one of the very handsomest sorts grown. In large plants the stalks, hearts and inner leaves become white without any blanching. Pkt. 5 cts., oz. 25 cts., $\frac{1}{4}$ lb. 90 cts.

SNOW WHITE. Of the White Plume class, but is still more easily blanched, of a purer white, of more vigorous growth. Pkt. 5 cts., oz. 25 cts., $\frac{1}{4}$ lb. 90 cts.

CELERIAC, or TURNIP-ROOTED CELERY (Knollen Sellerie)

Sow in early spring; transplant the seedlings in May. They will be ready for cooking in October, and may be preserved in dry sand for use during winter. Celeriac is said to be as fine a nerve tonic as celery, and can be grown in many sections where celery culture is practically impossible. The roots have almost the same flavor as white celery stalks, while they keep much longer than celery. An ounce of seed will produce about 2,000 plants.

PRAGUE GIANT. Roots are very large. When young they are quite tender and marrow-like, having a very fine flavor and cooking quickly. Pkt. 5 cts., oz. 20 cts., $\frac{1}{4}$ lb. 60 cts.

CAULIFLOWER

(Blumenkohl)

How to Grow Fine Cauliflower. Culture for Cauliflower and cabbages is essentially the same, but to the former extra care given in applying fertilizers and moisture well repays the gardener. Sow the seeds for early and late crops as directed for cabbage, but do not set the early plants in the open field too soon, for if too much stunted by severe frosts they begin to form heads before they are strong enough to develop them well. Plants which have not headed before winter sets in may be stored in a cool cellar or coldframe, and will form heads there without any further attention. A deep, loamy soil, with a substratum of moisture during dry weather, is most suitable for the Cauliflower. An ounce of seed will produce about 1,500 plants.

BECKERT'S EARLY SNOWBALL. Produces large, handsome heads, measuring 8 to 10 inches across; pure snowy white, close, compact and of the finest quality. The stalks are short, of compact growth, and can be planted closely. It is extra-early, a very certain header, and equally good for a late crop. Unsurpassed by any strain offered. Pkt. 20 cts., $\frac{1}{4}$ oz. 90 cts., oz. \$3.50.

DANISH GIANT, or DRY WEATHER. Similar to Snowball in size, quality, etc., but matures about one week later and is a better drought- and heat-resister. Pkt. 20 cts., $\frac{1}{4}$ oz. 90 cts., oz. \$3.50.

EXTRA-EARLY ERFURT. The plants may be depended upon to form large, firm, white heads very early. Pkt. 15 cts., $\frac{1}{4}$ oz. 75 cts., oz. \$2.75.

CABBAGE SEED

Seed sown in hotbed or greenhouse about February 15 will give plants large enough to transplant into hotbeds about March 10. Set them 2 or 3 inches apart each way, and as soon as they become well established remove the glass for part of the day, to harden them for final transplanting into the open ground, increasing the exposure daily until April 10 or 20, when the final transplanting may be made. Plants for this early crop need not stand further apart than $1\frac{1}{2} \times 2$ feet. For late crops, sow seeds in April or May, and transplant to the open ground when large enough, setting the plants up to the first leaf, and 2×3 feet apart. It is important that the plants should not stand thick in the seed-beds, as this would induce weak, slender plants. To insure large, solid heads of Cabbage, the

Extra-Early Jersey Wakefield

Arlington White Spine Cucumber

CUCUMBERS (Gurfe)

The seed cannot be planted in the open ground before the weather has become warm and settled, and the ground mellow and light. Plant the seeds in well-enriched hills about 4 feet apart each way, and as soon as all danger from insects is over thin the plants to leave four of the strongest in each hill. For succession, sow at intervals of every two weeks until midsummer. Extra-early crops are grown by planting the seed in hotbeds in April, upon pieces of sod turned upside down, and removing them to hills in open ground as soon as the weather is warm enough. For pickles, sow seed from the middle of June until the middle of July. The vines bear longer if the fruits are gathered as soon as they are large enough; their strength is soon exhausted by ripening fruits. An ounce of seed will plant 100 hills; 2 pounds will plant an acre.

IMPROVED FRENCH. Pkt. 10 cts., oz. 30 cts., ¼lb. \$1.10.

ENDIVE (Endivie)

This is an important fall and winter salad. For early, the seed should be sown in April, in drills 15 inches apart, and the seedlings thinned to stand 12 inches apart in the rows. Sowings for the main crop may be made in June and July, as the vegetable is used principally in fall and winter. The inner leaves are blanched by tying the tips of the outer ones together, or by laying boards over the plants. An ounce of seed will sow 150 feet of drill.

LARGE GREEN CURLED. Dark green leaves, beautifully curled, and when blanched very crisp and tender; ready for use earlier than other sorts. Pkt. 5c., oz. 25c.

BROAD-LEAVED BATAVIAN. The broad, thick leaves make excellent salads when blanched. Pkt. 5 cts., oz. 20 cts.

London Flag Leek (See opposite page)

KOHLRABI

(Kohlrabi)

Very palatable when prepared for the table like turnips. If the weather is favorable the seed should be sown in April, in rows 18 inches apart, and the seedlings thinned to stand a foot apart for White Giant, and 6 to 8 inches apart for other sorts. They are fit for use when 3 or 4 inches in diameter. For late crops, sow seeds in June or July. An ounce of seed will produce about 2,500 plants.

VERY EARLY WHITE VIENNA. The earliest sort. The plants grow rapidly, have small foliage, and mature their fine, round, white bulbs quite early. Pkt. 5 cts., oz. 25 cts.

EARLY PURPLE VIENNA. This variety differs from the above mainly in the color of its roots, which are bluish purple. Pkt. 5 cts., oz. 25 cts.

GREEN GIANT. A late, very large-growing sort, with immense bulbs, stems and leaves. Pkt. 5 cts., oz. 20 cts.

EGGPLANT (Eierpflanze)

Sow the seed in hotbeds early in March, transplant to small pots and plunge them in the same beds; this is to make them strong and stocky. They should not be planted out until May or June, when the weather becomes warm and settled, as cool nights and wet weather will check their growth. Set the plants in rows 3 feet apart each way and give them thorough cultivation, drawing the earth up to the stems when they are about a foot high. Repeated sowings are sometimes necessary, as the seed does not germinate freely without strong and uniform heat. An ounce of seed will produce 1,000 plants.

NEW YORK IMPROVED THORNLESS. The leading variety; strong and productive in habit. The fruits are deep purple, large, smooth, free from thorns; flesh white, tender, of delicate flavor. Pkt. 5 cts., oz. 30 cts.

JAPANESE GIANT. Of Japanese origin. Fruit of very large size, quite round in form and of a brilliant blackish violet color; flesh white and firm, contains few seeds and of the best quality. Pkt. 25 cts.

Very Early White Vienna Kohlrabi

Curled Mosbach Kale

LETTUCE (Garten Salat)

Seed for the first outdoor crop is usually sown in hotbeds in February, and the seedlings transplanted to the garden in April, 8 to 12 inches apart, in rows 12 inches apart. For a succession until frost, sow in drills in the open ground at intervals of every two or three weeks, and thin the plants to stand 6 to 8 inches apart. For plants to force in hotbeds from November until spring, sow seed in hotbeds in the fall, and cover up as winter approaches, until the plants are required for use. Or the seed may be sown in hotbeds early in winter and the seedlings transplanted when large enough into fine and well-prepared garden soil. Half an ounce of seed will sow 100 feet of drill, and produce about 1,500 plants.

Plant from six to twelve seeds in a hill, and when the young seedlings are strong enough to resist the attacks of insects, thin them, leaving three of the strongest in each hill. An ounce of seed will plant about 100 hills.

ONION SEEDS and SETS (Zwiebel)

Good Onion Seed is of the greatest importance

Onions thrive best on a rich, deep, loamy soil. For sets, the seed should be sown very thickly in drills as early as possible in spring. In summer, as soon as the tops die down, harvest the bulbs and store them in a dry, cool place, spreading them in thin layers. Early in the following spring replant them 4 inches apart, in small drills 12 inches apart, and they will form into fine, large bulbs early in the season. Large Onions may also be grown from seed the first season if the land is strong and well manured, the seed sown thinly in drills a foot apart, and the seedlings thinned to stand 3 or 4 inches apart in the drills; they must be well cultivated

Improved Hollow Crown Parsnip

PARSNIPS (Pastinaken)

Sow the seed in drills 15 inches apart, as early as possible in spring, and thin the plants until they are 5 or 6 inches apart in the rows. The roots are much improved by frost; to be dug up as required. On the approach of cold weather, cover them heavily with manure or litter. Deep, rich, heavy soil is best suited to the culture of Parsnips, and the roots will be smooth and large if no fresh manure is used; this tends to make them coarse-grained and misshapen. An ounce of seed will sow 100 feet of drill; 5 pounds will sow an acre.

CRISP RADISHES

Summer varieties are best adapted for general crop. An ounce of seed will sow about 75 feet of drill.

BONORA, NATURE'S PLANT-FOOD

Is a recent discovery of an English chemist, and its analysis shows that it contains more soluble plant-food than any other fertilizer on the market, and its merits have been widely tested and proven by numerous expert gardeners, both in this country and in England. It is good for all plant life and exceedingly valuable for all pot-plants, for garden use and for the lawn. When applied to vegetable, flower or any variety of plant life, it stimulates a strong and rapid growth promotive to their earliest maturity, increases the product and improves the quality; and for these reasons it is specially recommended for early garden crops when earliest possible results are desired. For fruit and shade trees there is nothing to equal it. Gravel the soil and water profusely around the roots, so it may soak well into them. Containing so much active plantfood in a condensed form, a trial with its consequent results will demonstrate that it is by no means a costly fertilizer. Price, 4-oz. pkg., making 56 pts., 25 cts., by mail 30 cts.; 1-lb. pkg., making 28 gals., 50 cts., by mail 65 cts.; 5 lb. pkg., making 140 gals., by express, \$2.50. ble-acting in discharge. Discharges half the water on the up stroke and half on the down.

No. 311, with 1-inch suction pipe, strainer, 5 feet of 1/2-inch discharge hose, graduated Vermorel nozzle, and either jet or dasher agitator (state which). Each, \$9 50.

No. 312, with 1-inch suction pipe, strainer, two leads of 1/2-inch discharge hose, two graduated Vermorel nozzles, and either jet or dasher agitator (state which). Each, \$10 50.

Little Giant Spray. Brass. The labor of pumping is all done on the down stroke of the piston and nothing on the up stroke. The foot-rest steadies the pump, holding it in position. Each, \$3.50.

Daisy Force. Cheap and effective. Will throw a steady stream 40 to 50 feet. Each, \$1.

The Auto Sprayer. Eight to ten strokes of plunger in air-chamber will compress enough air to discharge the entire contents and make a continuous spray for nine minutes. This means that the sprayer can be charged in fifteen seconds, when it will work uninterruptedly long enough to spray a quarter acre of potatoes. The sprayer is light and, being carried by a shoulder-strap, a boy can carry it with ease and can cover ten times more area in a day than can be covered with the old-style sprayers. Made of brass, \$6 25; of galvanized steel, \$4.75. Extension pipes, 2-ft. lengths, brass, 35 cts.; steel, 30 cts.

SELECT LIST OF FLOWER SEEDS

A Revised List of the Best and most Popular Sorts, including Seeds of Annuals, Biennials, Perennials, and Stove and Greenhouse Plants

IN THE following pages we offer a careful and choice selection of fresh and pure Flower Seeds, including the best old and new varieties. No need of the flower garden has been neglected, for seeds of plants adaptable for every ornamental purpose, covering a wide range of form and color, height and habit, and the whole season with their bloom, may be found here.

Our Flower-Seed Packets are large and beautifully lithographed in colors, with directions for culture printed on one side; they are well filled with tested seeds of strong germinating power.

The Headings of the Various Divisions which follow—Choice Annuals for Bloom the First Season, Perennials for Permanent Planting, Ornamental Climbers, Seeds of Greenhouse Plants—make so clear the nature of each class of seeds offered that the usual puzzling and arbitrary signs and abbreviations are unnecessary. The copious index on the last page of the Catalogue will be found helpful to all who, without understanding plant habits and classifications, wish to turn quickly to any species.

Cornell Incubators and Peep-O'-Day Brooders for 1906

STANDARD CORNELL INCUBATORS

Construction Principles

The Standard Cornell Incubator is a machine built for business,—one that will give perfect results to the market Poultryman who is

using Incubators as a means to a livelihood as well as to the amateur breeder who is operating them for pleasure.

It is constructed on correct principles and embodies a balanced system of Heating, Regulation, Ventilation, Circulation and Supplied Moisture. Each individual part of this system is perfect in itself for the specific purpose intended, but it is essential that each part be inseparably connected one with the other in order to enable the whole to perfectly perform the act of incubation.

Cornell Incubators and Peep-O'-Day Brooders have been shown at a number of the leading

exhibitions throughout the country and have been awarded first prizes in actual experience, in sharp competition on eight occasions in 1905, including the Portland Exposition, when two Gold Medals were taken.

CONSTRUCTION. The best grade of first-class Virginia Chestnut is used in making the panels, and they are put together with extra long tenons and mortises and carefully glued. It is impossible for the Cornell to spring a panel or open a joint in damp locations or in tropical climes.

The design of the Cornell embodies several exclusive features. One of the most noticeable and most important is the Patented Table Top which affords the operator clear surface upon which to place the eggs when turning or cooling them. It absolutely protects the Regulator Arm and its sensitive mechanism from outside interference.

Another feature is the piano-fitting legs, which are readily attached and adjusted without tools or trouble.

INSULATION. The double walls of the case are packed with cotton batting that has been made light and fluffy in a specially constructed picking machine. The top of the machine is protected by a laminated cotton batting and straw-board packing. Layers of cotton batting alternating with sheets of heavy straw board laid tier after tier, snugly filling the entire space, form an insulation so effective that air cannot circulate through or around it and carry away any of the heat. The thorough system of packing and insulation makes it possible in an emergency to operate the Cornell in an open shed, even during severe weather.

The front of each machine is provided with a Compound Door, both complete in every respect and screwed one onto the other with an air space between them. The edge of each door is fitted with felt so as to render it air tight all around, and as each door fits closely against a rabbet in the case of the Incubator, the glass front of the Cornell Incubator is as secure against the cold as any other part.

THE THERMOSTAT. The quadruple-action all-metal Thermostat is composed of four leaves of zinc and two of steel. It is as sensitive and accurate as a thermometer and positively indestructible. Comparative tests have proven that it excels any similar device that has ever been invented.

THE HEATER. The Fire- and Smoke-proof Heater of the Cornell is made of heavy galvanized iron, double-seamed, flanged and riveted at all the joints. The Heater is placed at one side of the Incubator, entirely clear of it, with the lamp 7 inches distant from the woodwork. The direct heat from the lamp flame does not pass into the hatching chamber, but is separated by double metal walls composing the lamp chimney, the fresh-air intake and the escape flue. The lamp fumes and gases are discharged into the outer air through the last named, and cannot gain access into the Incubator. The entire Heater is encased by a laminated asbestos jacket 2 1/4 inches thick.

THE LAMP. The Automatic Moisture Lamp is made of heavy galvanized iron with an interior perforated ring half the diameter of the

bowel, which braces the top and bottom and does away with the "bellows action" when pressing the lamp against the heater. There is a double top with moisture pads which automatically supply moisture into the egg chamber when required.

THE CORNELL NURSERY. The Cornell Nursery for chicks is situated immediately below the egg tray. As soon as released from the shell, the chicks move forward, attracted by the light, and fall to the burlap frame and find a snug comfortable resting place until the hatch is cleaned up, when they are ready to be taken to the Brooder.

THE PEEP-O'-DAY BROODER

Has been on the market for fifteen years and is used and recommended by nearly every Government Experiment Station and successful Poultryman the world over. The Peep-O'-Day Brooder is the best and always has been the best since its conception.

All styles are equipped with the Peep-O'-Day Lamp of malleable iron. This is the one dependable brooder lamp that has been invented to this date, and it does perfect work under the most trying and adverse circumstances. The construction is first-class throughout.

THE LAMP. The Peep-O'-Day Lamp is composed of two distinct parts—the oil fount of malleable iron comes in one solid piece and the lamp slide is made of heavy sheet iron. When the lamp is complete and in position in the brooder, the slide acts as a floor as well as the outer wall of the lamp chamber which contains the burner only. The oil fount is exposed to the currents of outer air which continually circulate around it. This is the reason that the Peep-O'-Day Lamp is superior to every other device that has been invented for the purpose.

HEATING AND VENTILATION. The system of heating and ventilation insures a continuous supply of fresh, warmed air to the chicks in the Brooder. The fresh air enters through openings on either side below the floor of the Brooder, passes over the metal diaphragm, gradually acquires the proper temperature when it comes in contact with the heated dome, then rises into the hover casting and is uniformly diffused through a perforated metal cylinder into the circular hover. Should the hover temperature go too high the warmed air finds its exit through openings in the cone register, which acts as a thermostat and is controlled by a slight turn of the hover; on the other hand, should the temperature be too low, close the register and the warmed air is retained under the hover. This perfect system of heating avoids warm spots in the Brooder and prevents the chicks from crowding.

CORNELL GALVANIZED IRON DRINKING FOUNTAINS

The Cornell Drinking Founts are made of heavy galvanized iron, double seamed, carefully turned and soldered. They are conical in shape so that in freezing weather the pressure of the ice inside will not split the seams. The top is also conical and avoids the fowls roosting and polluting the water. The pans are of pressed iron. Construction and material easy to clean and keep clean. Made in four sizes: 1 qt. 20 cts. each, 50 cts. for three, 90 cts. for six; 2 qt. 25 cts. each, 70 cts. for three, \$1.25 for six; 3 1/2 qt. 35 cts. each, \$1.00 for three, \$1.80 for six; 7 qt. 50 cts. each, \$1.40 for three, \$2.50 for six.

CORNELL GALVANIZED IRON GRIT AND SHELL BOXES

This is a sanitary, practical labor-saving device for feeding grit, shell, charcoal, dry foods or Beef Scraps. Has three compartments holding three quarts each. It is provided with a slanting hinged cover which protects the contents and prevents the fowls from roosting on the box. A strong wire handle affords means of hanging it against the wall of the poultry house. 50 cts. each, \$5.50 per doz.

CORNELL FEED SAVER

An invaluable device for feeding wet mash or whole grain. As shown by the illustration, only the heads of the birds are admitted to the trough; after they are satisfied, the feed remains clean and sweet, not soiled or wasted, as when fed from a pan.

Our Feed Saver gives all the birds a fair show, as the greedy ones cannot occupy the whole space, crowding away the weaker ones.

It is made in two sizes and shipped "knocked down." Trough with space for 20 birds 75 cts.; trough with space for 35 birds \$1.

THE CORNELL TRAP NEST

A Trap Nest is a necessity to the intelligent breeder, whether he keeps a flock of a dozen or a thousand hens. It is the means of establishing a good laying strain of strong vigorous birds, whose progeny will also be strong, vigorous birds, and layers of good fertile eggs.

Single Nest complete \$1.75 each; in Batches of six \$1.50 each; by the hundred \$1.35 each.

CORNELL REMEDIES AND INSECTICIDES

The Cornell MEDICINE CASE contains ten standard remedies, tested and highly recommended by experienced Poultrymen.

They are in tablet form, each securely sealed in a vial,—the ten vials enclosed in a strong cloth-covered case. Plain directions for use are printed on the inside cover of each case.

Price of Case complete, containing the ten remedies \$3 postpaid; Single vials in mailing tubes 40 cts. each, postpaid.

A BEAUTIFUL LAWN *Is the Result of Sowing Under Proper Conditions Our Evergreen Lawn Seed*

GOOD soil and proper drainage are absolutely necessary to produce a good lawn. There should be no less than one foot of good surface soil, heavy loam where possible. In light or sandy soil the grass has a tendency to burn out in hot, dry weather. Where it is necessary to grade the surface the subsoil should be removed and replaced with good earth.

Unless the soil is sufficiently rich apply a liberal quantity of well-rotted manure; dig or plow this in and incorporate with the soil. Rake or harrow the surface even, and after sowing the seed rake again lightly and firm the soil with a lawn-roller. Never attempt to dig, rake or roll a lawn when the ground is wet.

The best time to make a lawn is as early in spring as the ground is in good tillable condition, although very satisfactory results are obtained from lawns made during the summer and autumn.

When the young grass is from 3 to 4 inches high it should be mown, but not too short, as close cropping is injurious to a new lawn. Repeat the mowing at intervals of about ten days. After the lawn is once well established frequent rollings are beneficial, especially early in spring, after the soil and with it the roots of the grass have been drawn up by the winter's frost.

On banks and terraces, where the seed is liable to be washed off by rains before it has sprouted, a quick catch can be secured by mixing the seed with moist earth about one week before sowing; at the expiration of that time much of the seed is ready to sprout.

BECKERT'S EVERGREEN LAWN

Good seed is as necessary to make a lawn as the proper preparation of the ground. We have made many experiments to determine the grasses best adapted for lawn purposes, and the above mixture is composed of a combination in proper proportions, of the best natural lawn grasses, so as to produce a continuous good lawn from early spring throughout the summer until late in fall.

The ingredients of this mixture are the highest grade of re-cleaned seeds only. The value of lawn grass seed can be best determined by its weight per measured bushel, the better the quality the heavier the weight. This Lawn Seed is sold by the standard bushel of 32 quarts (dry measure) and weighs no less than 22 pounds per bushel.

Lawn Seeds are generally sold on a basis of 14 pounds to the bushel, which will invariably fall one-third or more short of actual measure if composed of choice clean seeds, and where a bushel of 14 pounds holds out in measure, it must of necessity be largely composed of light, chaffy matter of no value.

Use 1 qt to 300 sq. ft., 4 to 5 bus. per acre. Qt. 20 cts., by mail 30 cts.; 2 qts. 35 cts., 3 qts. 50 cts., 4 qts. 60 cts., pk. \$1.15, ½ bus. \$2.25, per measured bushel of 22 pounds, \$4.50.

PUTTING GREEN MIXTURE

The very finest hardy low-growing grasses are contained in this mixture, producing a close and lasting green turf. Qt. 25 cts., pk. \$1.35, bus. of 28 lbs. \$5.

GOLF LINK MIXTURE

Composed of such grasses as will produce a turf suitable for golf links, cricket-tables or polo grounds. Qt. 20 cts., pk. 75 cts., bus. of 15 lbs. \$2.50.

SHADY NOOK LAWN MIXTURE

A mixture of grasses best adapted for sowing in shady places, where other grasses will not thrive. In nearly all lawns where there are trees there will be found bare, unsightly spots which can be made green and bright by using this mixture. Per measured bus. of 20 lbs., \$6, ¼ bus. \$3, pk. \$1.75, qt. 25 cts., by mail 35 cts.

LAWN FERTILIZERS

Stable manure should never be used as a top-dressing on a lawn, as it always contains large quantities of noxious weed seeds, and is objectionable on account of unsightliness and disagreeable odor.

ODORLESS LAWN FERTILIZER. A clean, high-grade fertilizer, free from disagreeable odor, especially prepared for us. Produces a rapid and rich green growth of grass. Should be sown broadcast, and applied in spring or fall. Quantity required, 10 lbs. for 300 sq. ft. 500, to 1,500 lbs. per acre. 5 lbs. 25 cts., 10 lbs. 45 cts., 25 lbs. 80 cts., 50 lbs. \$1.45, 100 lbs. \$2.55, 200 lbs. \$4.90, 500 lbs. \$11.75, 1,000 lbs. \$22.50, per ton \$43.

CANADIAN UNLEACHED HARDWOOD ASHES. Unequaled as a fertilizer for lawns. Not alone acting as a stimulant, but supplies natural plant-food, permanently enriching the soil. Cheap, clean from weed seeds, and no offensive odor. Apply in the fall or early in spring, so that the rain may leach the ashes and carry the elements down to the roots of the grasses, producing a rapid and rich green growth. Apply 1,500 to 2,000 lbs. per acre. Per barrel of 200 lbs. \$2.50, per 400 lbs. \$4.75, per 1,000 lbs. \$11, per ton \$20; no smaller parcels than barrel lots.

PURE RAW BONE MEAL. Contains nothing but pure raw animal bone. Vastly superior to steamed bone. 5 lbs. 22 cts., 10 lbs. 40 cts., 25 lbs. 70 cts., 50 lbs. \$1.25, 100 lbs. \$2, 200 lbs. \$3.80, 500 lbs. \$9, 1,000 lbs. \$17, per ton \$32.
